

Diagnosis and Treatment of Vascular Disease

ABSTRACT

The present invention is based at least in part on the discovery of a polymorphism
5 within the lysyl hydroxylase 2 (PLOD2) gene. Accordingly, the invention provides nucleic
acid molecules having a nucleotide sequence of an allelic variant of a PLOD2 gene. The
invention also provides methods for identifying specific alleles of polymorphic regions of a
PLOD2 gene, methods for determining whether a subject is or is not at risk of developing a
disease which is associated with a specific allele of a polymorphic region of a PLOD2 gene,
10 e.g., a vascular disease, based on detection of polymorphisms within the PLOD2 gene, and
kits for performing such methods. The invention further provides methods for classifying a
subject who is or is not at risk for developing, a vascular disease or disorder as a candidate
for a particular clinical course of therapy or a particular diagnostic evaluation. The invention
further provides methods for selecting a clinical course of therapy or a diagnostic evaluation
15 to treat a subject who is or is not at risk for developing, a vascular disease or disorder.
